

# EWaiL

**EWaiL** is a new sound technology that produces authentic sound with unprecedented depth in any ordinary space by integrating 'sound-chips'. In this concept soundwaves are produced through vibration of sound-chips that can be finished off with different materials (mirrors, tables, paintings, walls, chairs). Because of this the system can be integrated and therefore invisible to the eye, you would think the sound comes 'out of the wall' which is in fact possible.

The quality of this technology guarantees a very interesting result.

- No visible speakers and therefore optimum usage of space
- New dimension of sound; authenticity, detail and depth
- Optimum experience of sound even outside the 'hot spot'; every fibre in the room will become a sound carrier
- Great quality given any acoustic specifications
- Minimum feedback and therefore extremely suitable for auditoria and congress centres
- Compatible to any modern sound technologies
- Water-resistant; suitable for outside venues, terraces etc.
- Good sound brightness; suitable for projects in which the highest security measures are required ( airports, tunnels etc)
